

How to host the web app on Windows

In the **main.go**, the server listens on port **8085**.

Method 1:

Supposed the host name is **www.xyzcompany.com**. You can access the web app at **www.xyzcompany.com:8085** by doing port forwarding:

1. On the router admin page, forward incoming requests with port 8085 to the ip address of the computer that runs **famlink.exe**. For example, if the ip is **192.168.1.27**; forward 8085 requests to **192.168.1.27**. In addition, allow public access to port 8085 on Windows Firewall. Normally, when double-clicking **famlink.exe** to run; you are asked if you want to allow public access to port 8085. Enable that.

Method 2:

Host the web app with IIS search the internet: **how to host golang web app with IIS**

Method 3:

If the computer that runs famlink.exe doesn't host any web app on port 80, you can use the port 80 for famlink.

- * Modify main.go so that server listens on port 80

- * go build

- * on router admin page, forward port 80 requests to the computer that runs famlink.

- * When double-clicking famlink.exe to run, Windows Firewall asks if you want to allow public access to port 80. Enable that.
